Problem 1: Delivery for magic factory

Satisfying all constraints, find the maximum number of pallets of prittles that can be delivered, and show how for that number all pallets may be divided over the six trucks.

Solution:

We generalize this problem to n trucks. For each pallet place in a truck we introduce five variables, one for each type of building block. We have eight pallet places per truck, so we introduce $8 * 5 * n = 40 * n$ variables p_{ijk} for $i = 1, \dots, n$, $j = 1, \dots, 8$ and $k = 1, \dots, 5$ where for every i, j, k the value of p_{ijk} will be true if and only if a pallet of building block type k will be put on pallet position j in truck i .

As the weight of each of the n trucks may not exceed the capacity of 7800 kg, we express this by the formula

$$\bigwedge_{i=1}^n (\sum_{k=1}^5 (\sum_{j=1}^8 (p_{ijk} * w_k)) \leq 7800).$$

Where w_k is the weight of a pallet of type k . In the table below you can see the values of the different types of pallets.

Table 1: Weights of the different types of pallets

Pallet type	Corresponding k	Weight (kg)
Nuzzles	1	700
Prittles	2	800
Skipplles	3	1000
Crottles	4	1500
Dupples	5	100

As prittles and crottles are not allowed to be put in the same truck, that is, for every two distinct positions j, m in truck i it is not allowed that both p_{ij2} and p_{im4} are true. This is expressed by the formula

$$\bigwedge_{i=1}^n (\neg (\bigvee_{j=1}^8 p_{ij2}) \vee \neg (\bigvee_{m=1}^8 p_{im4})).$$

Next we assume that the first two trucks are cooled, so pallets of skipples cannot be placed in trucks 3 upto and including n . We express this by the formula

$$\bigwedge_{i=3}^n \bigwedge_{j=1}^8 \neg p_{ij3}.$$

No two pallets of the type dupples may be placed in the same truck, that is, for every two distinct positions j, m in truck i it is not allowed that both p_{ij5} and p_{im5} are true. This is expressed by the formula

$$\bigwedge_{i=1}^n \bigwedge_{j, m: 1 \leq j < m \leq 8} \neg p_{ij5} \vee \neg p_{im5}.$$

Similarly, we also need the requirement that at most one variable is set to true per pallet position in a truck. So for every two distinct pallet types k, m on position j in truck i it is not allowed that both p_{ijk} and p_{ijm} are true. This is expressed by the formula

$$\bigwedge_{i=1}^n \bigwedge_{j=1}^8 \bigwedge_{k, m: 1 \leq k < m \leq 5} \neg p_{ijk} \vee \neg p_{ijm}.$$

Finally, we consider the requirements of the demands.

The total formula now consists of the conjunction of all these ingredients, that is,

This formula is easily expressed in SMT syntax, for instance, for $n = 6$ one can generate

```
(benchmark test.smt
:extrapreds (
(p11) (p12) (p13) (p14) (p15) (p16) (p17) (p18)
(p21) (p22) (p23) (p24) (p25) (p26) (p27) (p28)
(p31) (p32) (p33) (p34) (p35) (p36) (p37) (p38)
(p41) (p42) (p43) (p44) (p45) (p46) (p47) (p48)
(p51) (p52) (p53) (p54) (p55) (p56) (p57) (p58)
(p61) (p62) (p63) (p64) (p65) (p66) (p67) (p68)
(p71) (p72) (p73) (p74) (p75) (p76) (p77) (p78)
(p81) (p82) (p83) (p84) (p85) (p86) (p87) (p88)
)
:formula
(and
(or (p11) (p12) (p13) (p14) (p15) (p16) (p17) (p18) )
(or (p21) (p22) (p23) (p24) (p25) (p26) (p27) (p28) )
.....
(or (not p11) (not p12))
(or (not p11) (not p13))
.....
))
```

Applying `yices -e -smt test.smt` yields the following result within a fraction of a second:

```
sat
(= p11 false)
(= p12 false)
(= p13 false)
(= p14 true)
(= p15 false)
(= p16 false)
```

```
(= p17 false)
(= p18 false)
(= p21 false)
(= p22 true)
(= p23 false)
.....
```

The values that are true are $p_{14}, p_{22}, p_{37}, p_{43}, p_{56}, p_{68}, p_{75}, p_{81}$. Expressed in a picture this yields

Figure 1: Placement of pallets on truck. The first two trucks have facility for cooling skipplies.

We check that indeed there are eight queens for which no two are on the same row, column or diagonal.

Remark:

Our formula contains some redundancy: the requirement that every row contains exactly one queen implies that there are exactly n queens in total. By expressing that every column contains at least one queen, from this property one concludes that also every column contains at most one queen. We chose for this redundancy for keeping the symmetry in the solution, and also following the general strategy that introducing redundancy is often good for efficiency.

Generalization:

As we generalized our approach for n rather than 8, it is interesting to see what happens for other values of n . For $n > 10$ we have to take care of the notation: if we keep the notation then it is not clear whether p_{111} represents $p_{1,11}$ or $p_{11,1}$. This is solved by putting an extra symbol between the two numbers.

For $n = 3$ the resulting formula is unsatisfiable, showing that there is no solution. For $n = 4, 5, 6, \dots$ the formula is satisfiable, by which a solution of the problem is found. Efficiency is not a problem: for $n = 60$ there are 3600 variables and the formula consists of over 350,000 clauses, but still **yices** succeeds in finding a solution within a few seconds.

Problem 2: Placing components on a power grid

To identify each component, we have named them a, b, \dots, h , with sizes 9×7 , 12×6 , 10×7 , 18×5 , 20×4 , 10×6 , 8×6 and 10×8 . Furthermore, we named the power components i, j, k . The specification that each component can be turned to 90° , can be simplified to swapping the x and y dimensions of a component with each other. For each component, we introduce predicates $a_turned, b_turned, \dots, k_turned$ to indicate rotation, and $a_lx, a_ly, b_lx, b_ly, \dots, k_lx, k_ly$, for the lengths and widths of a, b, \dots, k . So the dimensions of each component are determined as follows:

```
(= a_lx (ite a_turned 7 9))
(= a_ly (ite a_turned 9 7))
...
```

We identify the origin of each component, with predicates $a_ox, a_oy, b_ox, b_oy, \dots, k_ox, k_oy$ to denote x-origins and y-origins. To specify the size of the chip, we have to make sure that all components are within the limits of the length and width:

```
(<= (+ a_lx a_ox) 29)
(>= a_ox 0)
(<= (+ a_ly a_oy) 22)
(>= a_oy 0)
...
```

We must also make sure that none of the components overlap.

[Insert fancy formulas here]
